

ABSTRACTGLIDING BOARD

A gliding board (1), including a gliding surface (4) that terminates in at least one raised end (2), said
5 end (2) including a peripheral zone (5) and a central zone (6), the peripheral zone (5) extending from the side (9) of the board toward the central zone (6) of said end, this peripheral zone (5) having a thickness (e1) which is less than that (e2) of the central zone
10 (6) of the end and being connecting to the latter by a discontinuity (7) that forms an inflexion, wherein the width (d) of the peripheral zone (5), measured perpendicularly to the side (9) of the board, increases from the beginning of the end as far as the highest
15 point (12) of the end.
